Profile

Backend Engineer with 3.5+ years of experience building high-performance systems in Java and Spring Boot. Specialized in internal tooling, Kafka-based messaging, scalable data pipelines, and caching. Strong focus on system reliability, developer productivity, and platform-level optimization.

Experience

Kapture CX

August 2022 – Present

Software Development Engineer 2

Bengaluru, India

- Architected and rolled out a Kafka abstraction library utilized by over 90% of microservices; eliminated 80% of boilerplate by encapsulating producer/consumer configuration, and integrated built-in failover support, metrics instrumentation, and alerting hooks.
- Redesigned the Redis-based caching layer, using reducing cache fetch time by more than half and minimizing cache misses through optimized key design and TTL strategies.
- Built a high-throughput customer data migration platform processing millions of rows daily; graceful error handling and alerting mechanisms, enabling operations teams to reduce client onboarding time by weeks.
- Facilitated the redesign of a customer mail listener microservice to address issues of duplicate and spam emails, accelerating performance by transitioning from an internally hosted service to a managed cloud service.
- Developed a scalable full-text and attribute-based search system utilizing Elasticsearch across more than 30 fields. The system effectively supported complex queries by subject, ID, and phone number, achieving a 50% reduction in search time through query optimizations.
- Streamlined the large-scale export of live and historical email data from MySQL to cloud storage; achieved nearly 80% cost savings through batching, compression, and job scheduling enhancements.
- Deployed a secure, internal database management tool with role-based access control; adopted by 40+ technical and non-technical users, improving data update workflows.
- Engineered a reusable cloud file management library adopted across 18+ Java microservices; standardized upload flows, added traceability via audit logging, and enabled seamless integration with cloud storage APIs.
- Advanced system observability by standardizing API-level metrics collection, error logging, and alerting mechanisms using internal tools and chat integrations; significantly enhancing incident detection and response.
- Provided critical support during production outages through regular incident triage and root cause analysis; implemented preventive solutions to mitigate recurring system failures.
- Mentored 8 interns from onboarding through full-time conversion to SDE1 roles; currently coaching 2 SDE1s on scalable system design, code quality, and ownership best practices.

Kapture CX

May 2022 – August 2022

Software Development Engineer Intern

Bengaluru, India

- Modernized 8+ microservices with resilient design patterns including exponential backoffs, asynchronous processing, and transactional outbox/inbox; decreased average response time from 800ms to under 200ms and increasing service reliability metrics.
- Managed backend service for storing and retrieving configuration data across 12+ social media platforms; ensured reliable support for dynamic API integrations and versioned platform-specific settings.
- Developed and deployed a secure data handling pipeline for sensitive customer records using field masking, validation layers, and batch processing; handled 1000+ records per hour with robust logging.
- Redesigned customer notification service by introducing retry mechanisms including exponential backoff; boosting message delivery success rates by 50% across unstable network scenarios.

Education

NIE Institute of Technology

August 2018 – August 2022

Bachelor of Engineering in Information Science

Mysuru, Karnataka

Technical Skills

Languages: Java, Python, SQL, C, JavaScript, Golang, Bash, HTML/CSS

Technologies/Frameworks: Linux, Git, Spring Boot, Redis, Kafka, MySQL, Hibernate, Elasticsearch, Docker, Jenkins
